Build Python Code

Step 01: Importing Libraries

The first step is usually importing the libraries that will be needed in the program.

```
1    from flask import Flask , render_template
```

Step 2: Creating our flask application and loading

```
2    app=Flask(__name__)
```

Step 3: Routing to the Html Page

Here, the declared constructor is used to route to the HTML page created earlier.

The '/' route is bound with the bot function. Hence, when the home page of a web server is opened in the browser, the HTML page will be rendered.

```
3    @app.route('/')
4    def bank():
5        return render_template('Bank.html')
```

Main Function

This is used to run the application in localhost.

```
6    if __name__=='__main__':
7        app.run(debug = True)
```
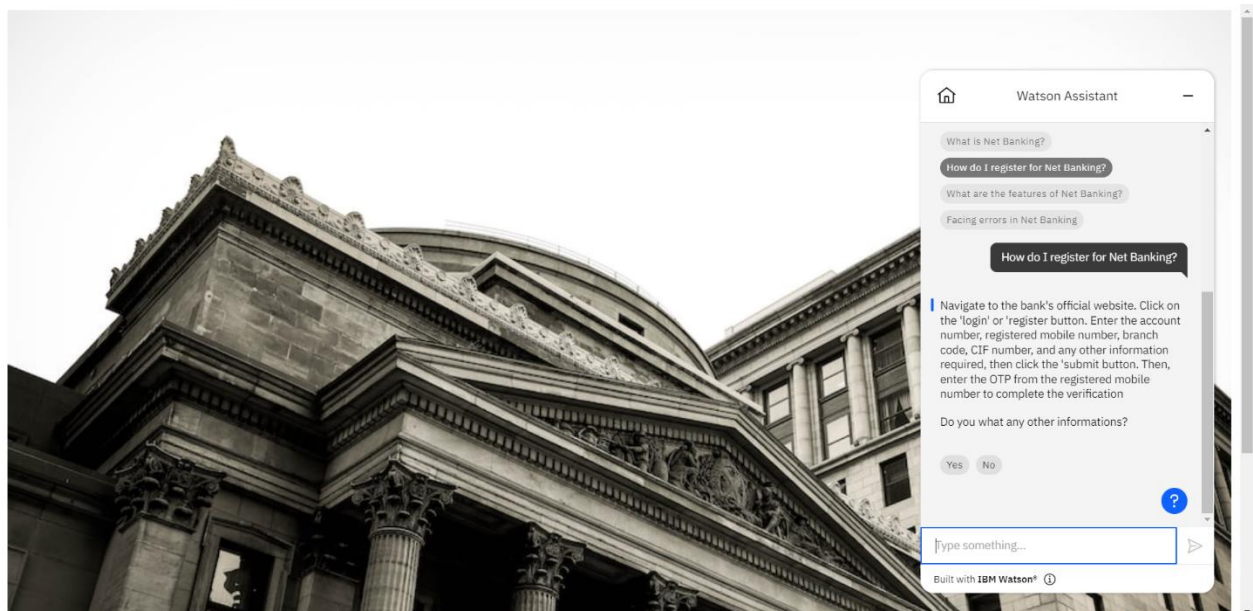

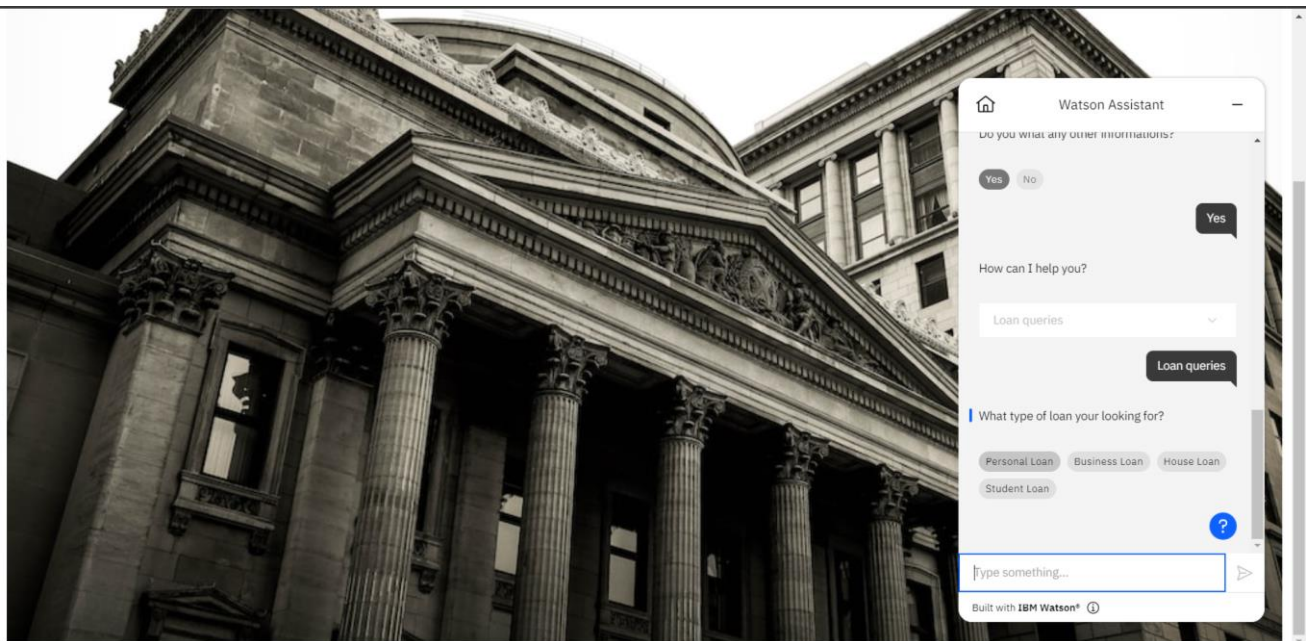

Run an Application:

Step 1: Savings Account

Step 2: Current Account

Step 3: Net Banking

Step 4: Loan Queries

Step 5: General Queries
